ABOUT ME

Backend developer specializing in Django and REST APIs, with a growing focus on AI/ML integration. I've built and shipped several full-stack projects – including a RAG-based research assistant, a Flask summarization tool using transformer models, and a Django e-commerce platform – each one an excuse to get better at clean architecture and production-ready code. Looking for a backend role where I can keep building things that actually work.

EDUCATION

Islamic Azad University, Tehran-North | 2022 - Present

Bachelor of Computer Engineering

INTERNSHIP

Django Web Development Trainee

Satrap Vira Sazan | Aug – Oct 2025

- Completed an intensive Django-focused training program, working hands-on with models, REST APIs, and core backend development practices
- Demonstrated strong technical growth, teamwork, and problem-solving ability
- Received a formal recommendation letter for continued professional development

PROJECTS

- **Student RAG** – Built a local, privacy-focused RAG application for law students to upload case documents and receive cited, source-grounded answers; includes both a CLI and a web interface.
- **Summarizer** – Developed a Flask web app that summarizes text, PDF documents, and audio files, using transformer models and the Groq API for fast inference.
- **Tweeter-demo** – Built a full-stack Twitter clone (Django/DRF + React) with a service-selector layered backend architecture; hardened serializers against injection and unsafe file uploads, fixed a gunicorn worker misconfiguration, and containerized the app with a multi-stage Docker build.
- **Online Shop** – Built a full-featured Django e-commerce platform using class-based views, with a clean, production-ready architecture designed for easy deployment.

SKILLS

- Languages: Python, JavaScript, HTML, CSS
- Backend & Frameworks: Django, Django REST Framework (DRF), Flask
- Database & Caching: PostgreSQL, MySQL, Redis
- API & Data: REST APIs, Serializers, CRUD Operations, JSON
- Async & Background Tasks: Celery, Redis (as broker)
- DevOps & Tools: Docker, Git & GitHub, Gunicorn
- AI/ML: Transformer Models (Hugging Face), Groq API, scikit-learn
